

ABSTRACT OF THE DISCLOSURE

A combination sink and jet parts washer for cleaning mechanical parts of oil, grease and contaminants. The washer has a cabinet which has a jet cleaning section and a reservoir.

5 A parts receptacle in the jet cleaning section receives the parts which are cleaned by a spray from a spray manifold. The manifold is connected to a fluid pump which has its inlet communicating with the reservoir. A sink is positioned on the top of the cabinet and opens to access the jet washer and reservoir. In the closed position, the sink covers the top of the cabinet and may be used as a sink washer using the attached brush. In a preferred
10 embodiment, the sink is hinged to the cabinet but may be a lift-off sink or may be on a track.

The jet parts washer provides convenience, economy and the features of a sink and jet washer in a single, compact, mobile unit.
